Field of the Invention The present invention relates to an optical disk drive, and more particularly, to a tilt sensor having an improved sensing accuracy. 2. Background of the Related Art In general, a conventional optical disk drive is constructed with three-axis actuators for moving an optical pickup onto the optical disk. The three-axis actuators are constituted with an actuator for moving the optical pickup, a first voice-coil motor (VCM) for moving the actuator, and a second VCM for driving the first VCM. The optical pickup receives a light beam emitted from a light source through a collimator lens and a polarizing beam splitter, and then the light beam transmitted through the beam splitter is directed to a spherical lens by a beam splitter and a quarter-wave plate. Then, a light beam reflected from the optical disk in response to the light beam incident on the optical disk is directed to a photo-detector by the spherical lens and the beam splitter. Meanwhile, a tilt of the optical disk varies the light beam incident on the photo-detector, which in turn provides a momentary current to the first and second VCM. Here, the first and second VCM move the optical pickup in a radial direction or an angular direction, and thereby the tilt of the optical disk can be controlled. In the meantime, as for a spindle motor for rotating the optical disk, it is preferred to be synchronized with the first and second VCM. A spindle motor of the optical disk drive requires an accurate speed control in order to precisely control the tilt of the
